

Processes and Job Control

Chonnam National University
School of Electronics and Computer
Engineering

Kyungbaek Kim

Process

- The kernel considers each program running on your system to be a **process**
 - **Lives** : as it executes
 - **Dies** : when it terminates
- The kernel identifies each process by a number known as a **process id (PID)**
- The kernel keeps track of various properties of each process

Processes in Linux

- Processes are represented by entries in a **Process Table**
- PID is index to a Process Table Entry
- A Process Table Entry is called as a **Process Control Block (PCB)**
- PCB is a large data structure that contains or points to all info about the process
 - In Linux, PCB is defined in *task_struct*
 - See *include/linux/sched.h*
 - Windows XP → EPROCESS structure

Example of task_struct

```
kbkim@ubuntu: /usr/src/linux-headers-2.6.32-38/include/linux
File Edit View Terminal Help

struct task_struct {
    volatile long state;      /* -1 unrunnable, 0 runnable, >0 stopped */
    void *stack;
    atomic_t usage;
    unsigned int flags;       /* per process flags, defined below */
    unsigned int ptrace;

    int lock_depth;           /* BKL lock depth */

#ifdef CONFIG_SMP
#ifdef __ARCH_WANT_UNLOCKED_CTXSW
    int oncpu;
#endif
#endif

    int prio, static_prio, normal_prio;
    unsigned int rt_priority;
    const struct sched_class *sched_class;
    struct sched_entity se;
    struct sched_rt_entity rt;

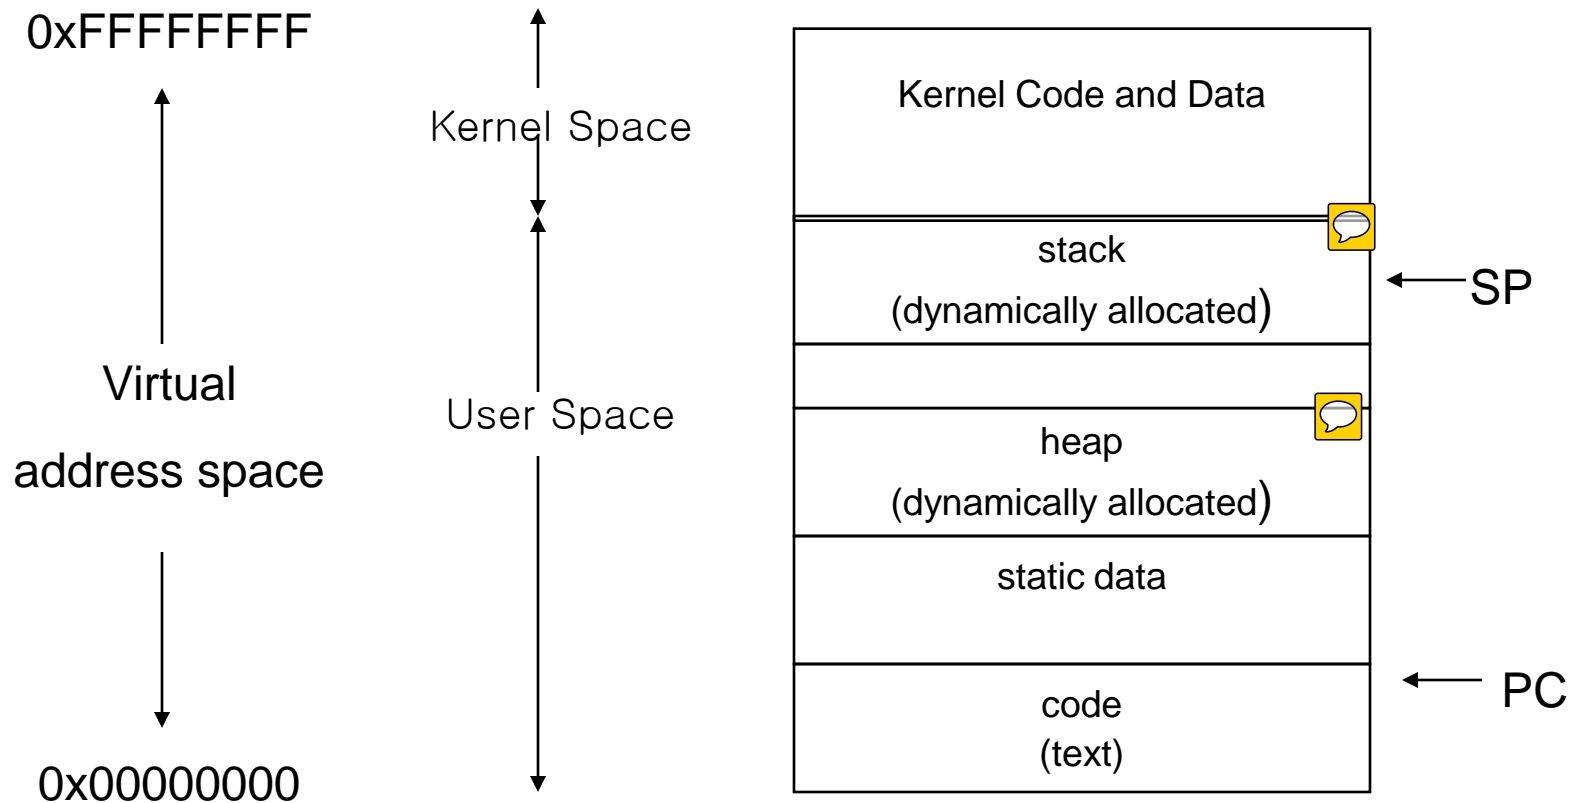

#ifdef CONFIG_PREEMPT_NOTIFIERS
    struct preempt_notifier notifier;
#endif
};
```

"sched.h" [readonly] 2624 lines --47%-- 1241,1 46%

Process components

- **Address space** – mapped into memory
- Code – program
- Data – initial data of program
- Execution Stack and Stack Pointer
 - Point the current running location of data
- Counter
 - Point the current running location of code
- A set of processor Registers
- A set of system resources
 - Files, pipes, privileges

32-bit based Address Space

Information of Process

- Information of works
 - Process state, pointer to memory area, current directory, pointers to file descriptors, signals received, scheduling priority of works
- Information of users
 - User id (UID), group id (GID)
 - Effective user id (eUID), effective group id (eGID)
- Information of relationship between processes
 - Process ID (PID), Parent Process ID (PPID), Process Group ID (PGID)

Process – PID and PPID

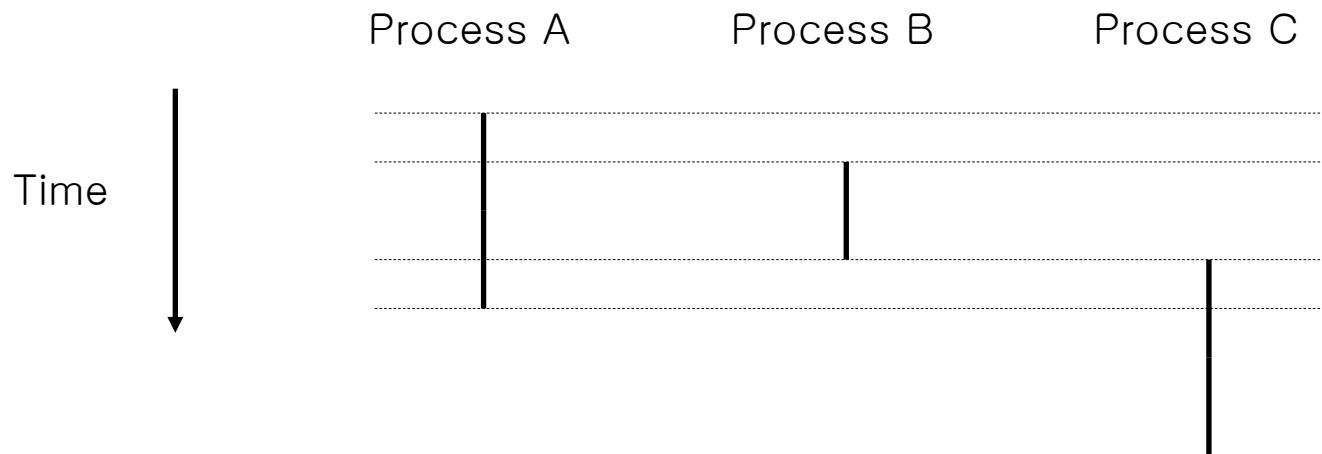

- Process ID – PID
 - A process ID is **a unique identifier** assigned to a process while it runs
 - Each time you run a process, it has a different PID
 - General PID range : 0 ~ 65535
 - It takes a long time for a PID to be reused by the system
- Parent Process ID – PPID 
 - A process that creates a new process is called a parent process, the new process is called a child process
 - The parent process becomes associated with the new child process when it is created

Process – PGID

- Process Group ID – PGID 
 - Each process belongs to a process group
 - A process group is a collection of one or more processes
 - If a command starts just one process, its PID and PGID are the same
 - Each process group has a unique process group ID
 - It is possible to send a signal to every process in the group just by sending the signal to the process group leader

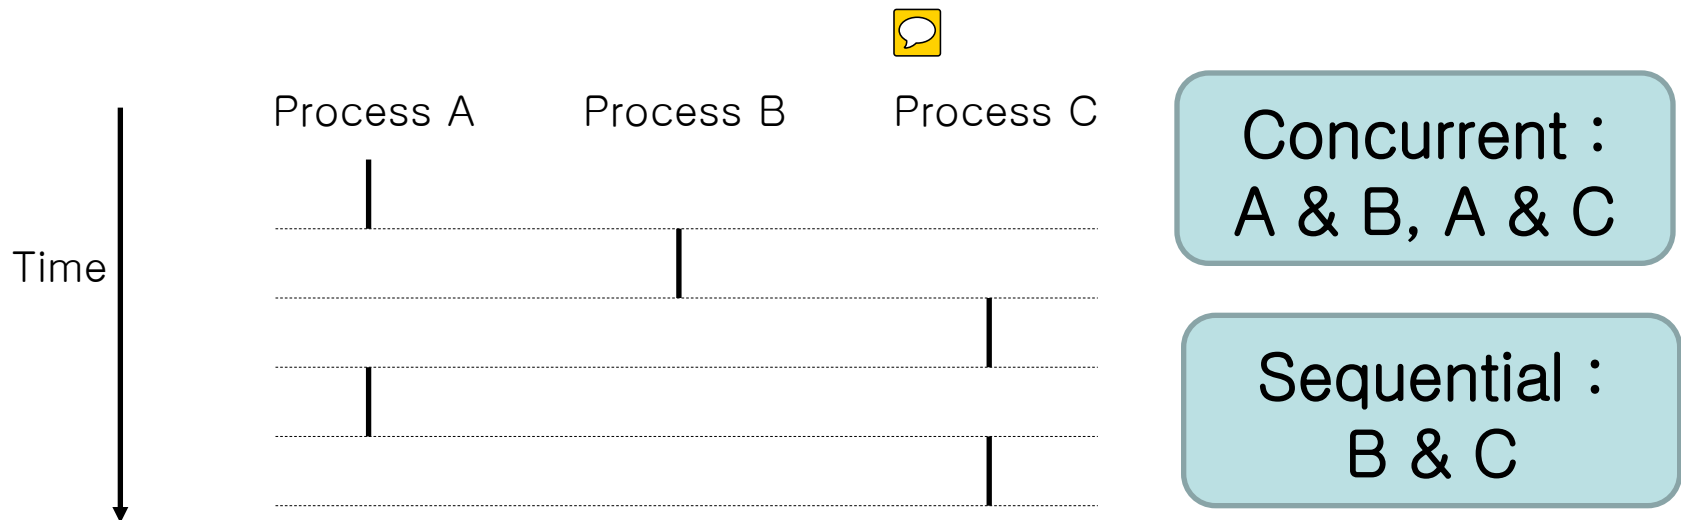

User view of Concurrent processes

- Users think of concurrent processes are running in parallel with each other.
- However, control flows for concurrent processes are physically disjoint in time

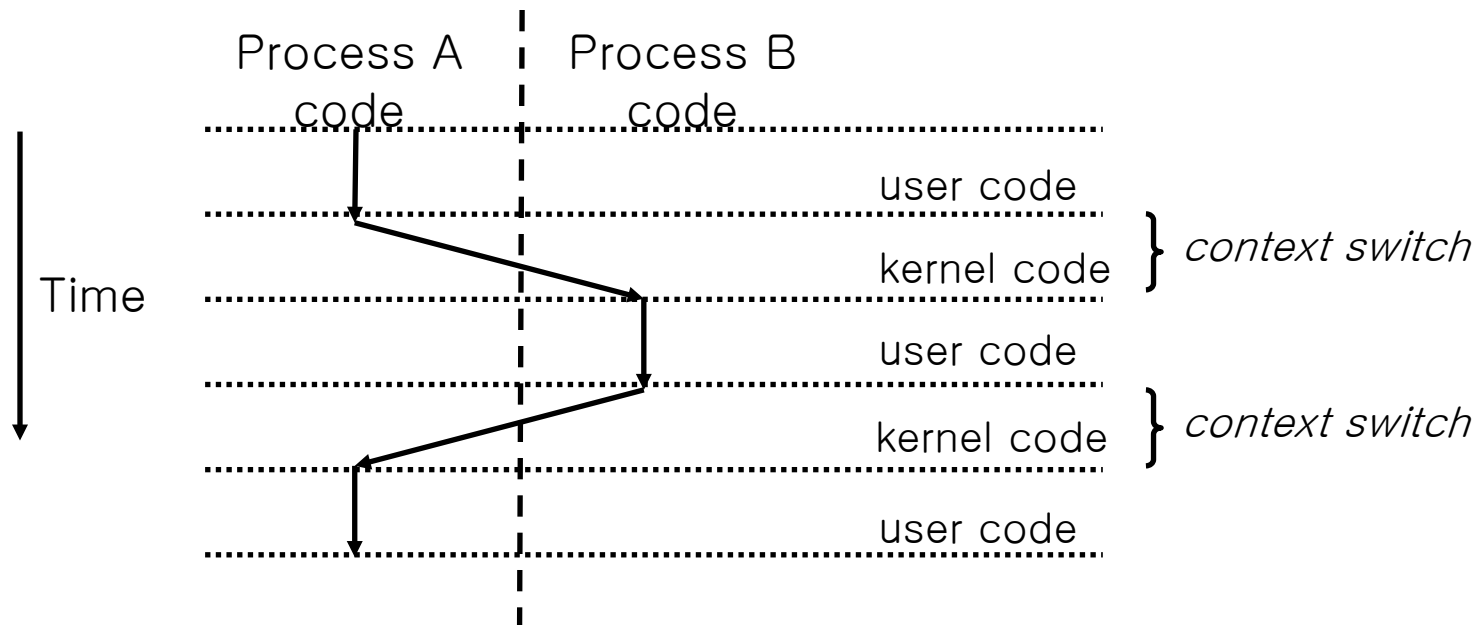

Logical Control Flow of Processes

- Each process has its own logical control flow
- Two processes **run concurrently (are concurrent)** if their flows overlap in time
- Otherwise, they are **sequential**

Context switching

- Control flow passes from one process to another via a **context switch**
- During context switching, kernel code **stores the PCB of the previous process** and **restores the PCB of the next process**

Starting and ending Process

- Processes are created ...
 - When the system boots
 - By the actions of another process (more later)
 - By the actions of a user
 - By the actions of a batch manager
- Processes terminate ...
 - Normally – exit
 - Voluntarily on an error
 - Involuntarily on an error
 - Terminated (killed) by the actions a user or a process

Creating new processes

- fork() 
 - Creates a new process (child process) that is identical to the calling process (parent process)
 - Allocates new PCB
 - Clones the PCB of the calling process (almost exactly)
 - Returns 0 to the child process
 - Returns child's pid to the parent process

```
if (fork() == 0) {  
    printf("hello from child\n");  
}  
else {  
    printf("hello from parent\n");  
}
```

Fork is interesting
(and often confusing)
because it is called
once but returns *twice*

PID and fork

Running new programs

- `int execl(char *path, char *arg0, char *arg1, ..., 0)`
 - Loads and runs executable at path with args `arg0`, `arg1`, ...
 - path is the complete path of the process
 - `arg0` becomes the name of the process
 - Typically `arg0` is either identical to path, or else it contains only the executable filename from path
 - “real” arguments to the executable start with `arg1`, ...
 - List of args is terminated by a `(char *)0` argument
 - Returns `-1` if error, otherwise doesn't return

```
main() {  
    if (fork() == 0) {  
        execl("/usr/bin/cp", "cp", "foo", "bar", 0);  
    }  
    wait(NULL);  
    printf("copy completed\n");  
    exit();  
}
```

Other possible
functions →
`execlp`, `execle`,
`execv`, `execvp`,
`execve`

Zombie Process

- A process that had never been waited for
 - `<defunc>`
- When a child process is terminated earlier than its parent process, the status of process is remained in kernel
- Using `wait()` is a solution to prevent generating zombie processes

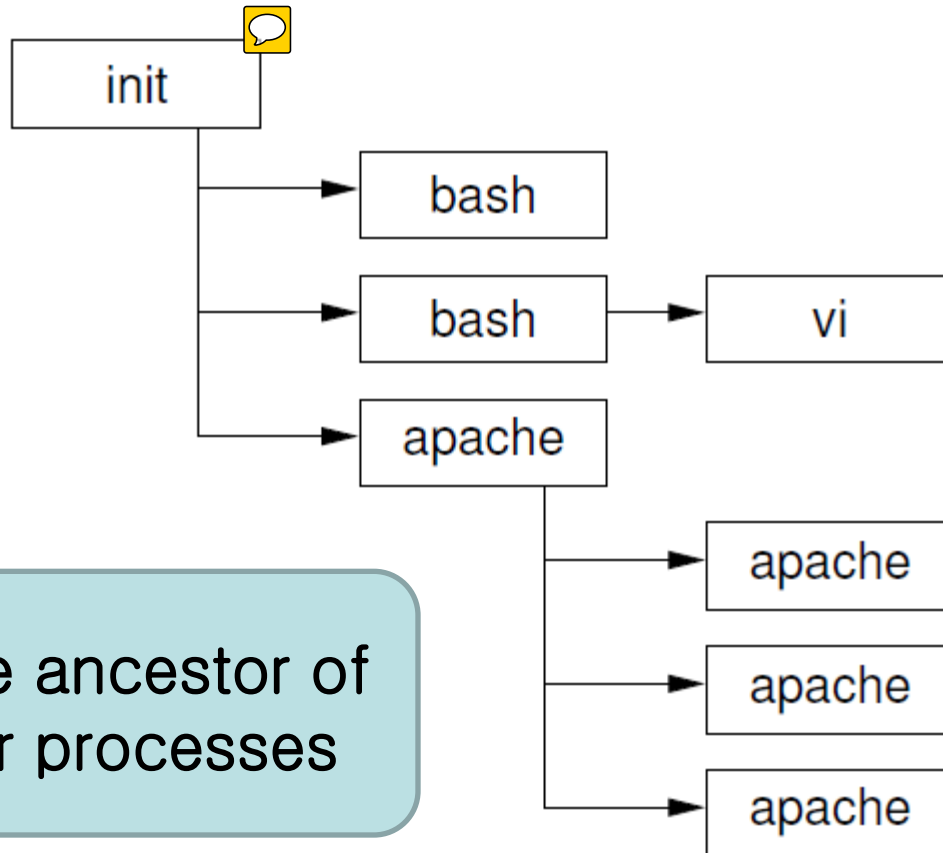

Synchronization with children

- `int wait (int *child_status)`
 - Suspends current process until one of its children terminates
 - Return value = the pid of the child process that terminated
 - If `child_status != NULL`, then the object it points to will be set to a status indicating why the child process terminated

```
main() {
    int child_status;

    if (fork() == 0) {
        printf("hello from child\n");
    }
    else {
        printf("hello from parent\n");
        wait(&child_status);
        printf("child has terminated\n");
    }
    exit();
}
```

Process Tree

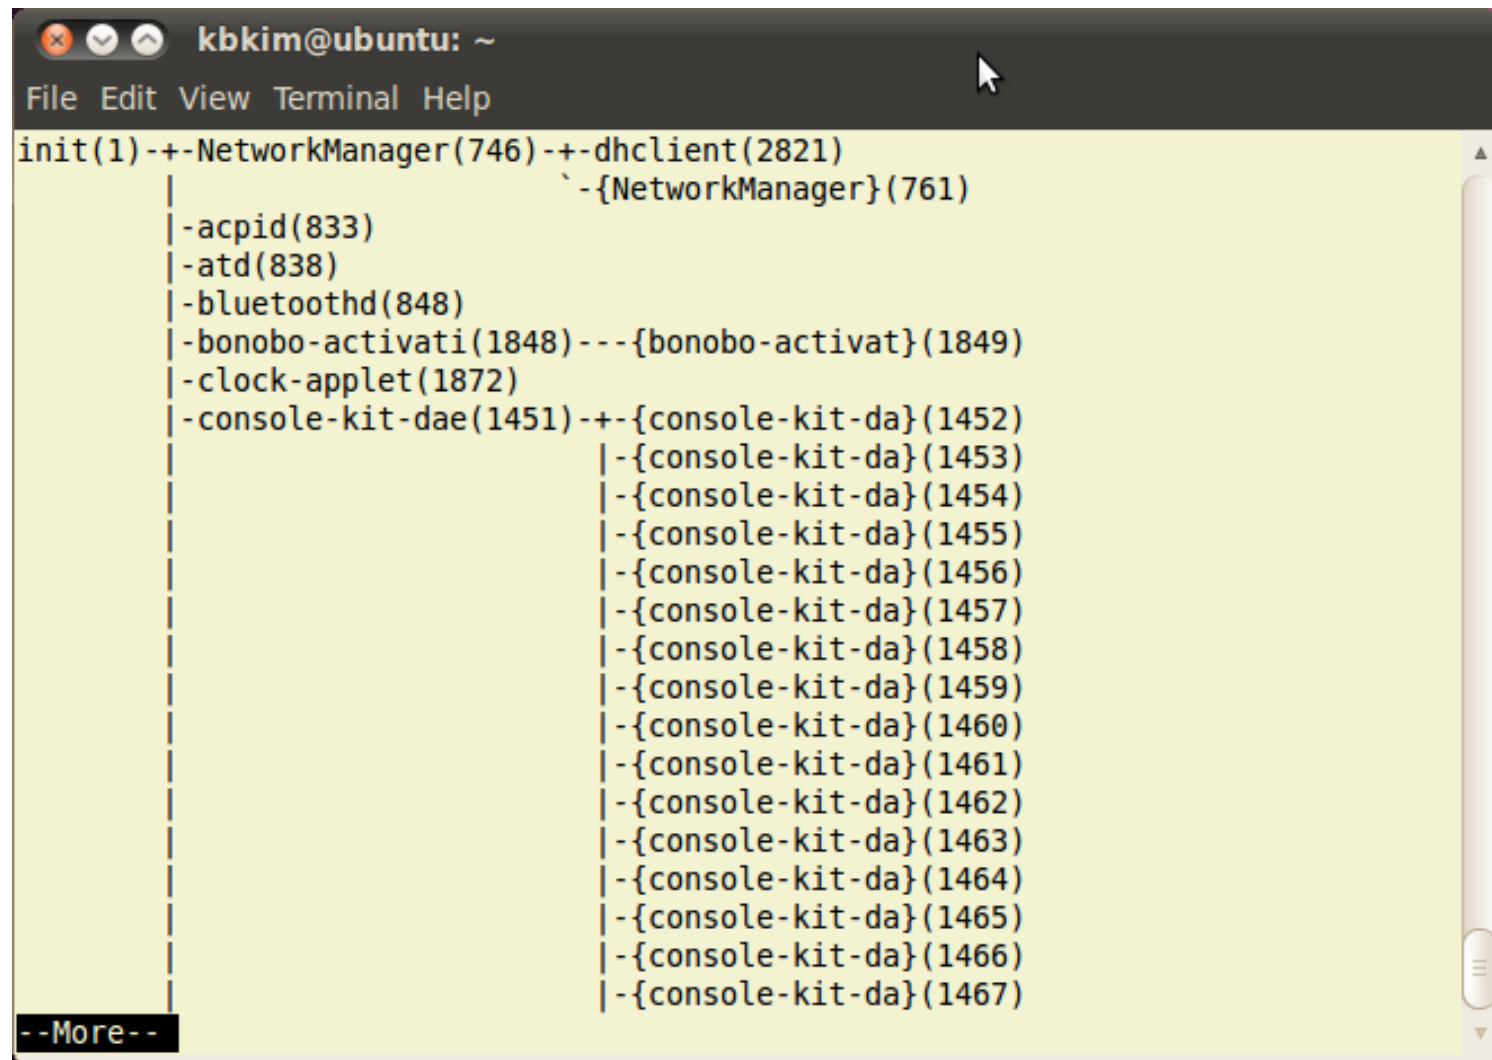

init is the ancestor of
all other processes

ps^{tree}

- Display a snapshot of running processes
- Always uses a tree-like display
- By default shows only the name of each command
- Normally shows all processes
 - Specify a pid as an argument to show a specific process and its descendants
 - Specify a user name as an argument to show process trees owned by that user

Example of “pstree -p”

```
kbbkim@ubuntu: ~

```

“ps” command

- Gives a snapshot of the processes running on a system at a given moment in time
- Very flexible in what it shows and how
 - Normally shows a fairly brief summary of each process
 - Normally shows only processes which are both owned by the current user and attached to a terminal
- Unfortunately, it doesn't use standard option syntax

Options of ps

Option	Description
a	Show processes owned by other users
f	Display process ancestors in a tree-like format
u	Use the “user” output format, showing user names and process start times
w	Use a wider output format.
x	Include processes which have no controlling terminal
-e	Show information of all processes
-l	Use a long output format
-f	Use a full output format
-C cmd	Show only processes named cmd
-U user	Show only processes owned by user

“ps -help” for more details.

Example of ps

TTY : associated terminal
TIME : cumulated CPU time
CMD : executable/command name
%CPU : portion of CPU usage
%MEM : portion of memory usage
VSZ : Virtual memory usage
RSS : **Physical memory usage**
STAT : process state
START : starting time of the process

```
kbkim@ubuntu: ~

top

- Show full-screen, continuously-updated snapshots of process activity
 - Waits a short period of time between each snapshot to give the illusion of real-time monitoring
- Processes are displayed in descending order of how much processor time they are using
- Also displays system uptime, load average, CPU status, and memory information
- Options
 - -d delay : wait delay
 - -i : ignore idle processes

Interactive commands of top

Key	Behavior
q	Quit the program
Ctrl+l	Repaint the screen
h	Show a help screen
k	Prompt for a pid and a signal and send that signal to that process
n	Prompts for the number of processes to show information
r	Change the priority of a process
s	Change the number of second delay
M	Sort the processes based on memory usage
P	Sort the processes based on CPU usage

Signaling Process

- A process can be sent a signal by the kernel or by another process
- Each signal is a very simple message:
 - A small whole number
 - With a mnemonic name
- Signal names are all-capitals, like **INT**
 - They are often written with SIG as part of the name : **SIGINT**
- Some signals are treated specially by the kernel
 - Others have a conventional meaning
- There are about 30 signals available

Available Signals

A terminal window titled 'kbbkim@ubuntu: ~' with a menu bar containing 'File', 'Edit', 'View', 'Terminal', and 'Help'. The terminal shows the command 'kill -l' being executed, which lists all available signals in a 5-column grid. The signals are numbered 1 through 64. The window has standard Ubuntu window controls (close, maximize, minimize) in the top-left corner and a vertical scrollbar on the right side.

```
kbbkim@ubuntu:~$ kill -l
1) SIGHUP      2) SIGINT      3) SIGQUIT     4) SIGILL      5) SIGTRAP
6) SIGABRT     7) SIGBUS      8) SIGFPE      9) SIGKILL     10) SIGUSR1
11) SIGSEGV    12) SIGUSR2    13) SIGPIPE     14) SIGALRM     15) SIGTERM
16) SIGSTKFLT  17) SIGCHLD    18) SIGCONT     19) SIGSTOP     20) SIGTSTP
21) SIGTTIN    22) SIGTTOU    23) SIGURG      24) SIGXCPU     25) SIGXFSZ
26) SIGVTALRM  27) SIGPROF    28) SIGWINCH    29) SIGIO       30) SIGPWR
31) SIGSYS     34) SIGRTMIN   35) SIGRTMIN+1  36) SIGRTMIN+2  37) SIGRTMIN+3
38) SIGRTMIN+4 39) SIGRTMIN+5 40) SIGRTMIN+6  41) SIGRTMIN+7  42) SIGRTMIN+8
43) SIGRTMIN+9 44) SIGRTMIN+10 45) SIGRTMIN+11 46) SIGRTMIN+12 47) SIGRTMIN+13
48) SIGRTMIN+14 49) SIGRTMIN+15 50) SIGRTMAX-14 51) SIGRTMAX-13 52) SIGRTMAX-12
53) SIGRTMAX-11 54) SIGRTMAX-10 55) SIGRTMAX-9  56) SIGRTMAX-8  57) SIGRTMAX-7
58) SIGRTMAX-6 59) SIGRTMAX-5 60) SIGRTMAX-4  61) SIGRTMAX-3  62) SIGRTMAX-2
63) SIGRTMAX-1 64) SIGRTMAX
```

Common Signals

name	number	meaning
INT	2	Interrupt – Stop running . Sent by the kernel when Ctrl+C is pressed in a terminal
TERM	15	“please terminate” used to ask a process to exit gracefully
KILL	9	“ Die! ” Forces the process to stop running; it is given no opportunity to clean up after itself
TSTP	18	Requests the process to stop itself temporarily. Sent by the kernel when Ctrl+Z is pressed in a terminal
HUP 	1	Hang up. Sent by the kernel when you log out. Conventionally used by many daemons as an instruction to re-read configuration file
CHLD	17	Notify signal to its parent process 

Sending signals : “kill” command

- The “kill” command is used to **send a signal** to a process
 - Not just to terminate a running process.
- It is a normal executable command, but many shells also provide it as a built-in 
- Use “kill -HUP pid” or “kill -s HUP pid” to send a SIGHUP to the process with that pid
- If you miss out the signal name, kill will send a SIGTERM
- Special kill : **kill -9 -1**  → kill all process you can kill

Example of kill

```
kbkim@ubuntu: ~  
File Edit View Terminal Help  
kbkim@ubuntu:~$ ps  
  PID TTY          TIME CMD  
 3547 pts/0        00:00:00 bash  
 4431 pts/0        00:00:00 xterm  
 4447 pts/0        00:00:00 xterm  
 4490 pts/0        00:00:00 ps  
kbkim@ubuntu:~$ ps  
  PID TTY          TIME CMD  
 3547 pts/0        00:00:00 bash  
 4431 pts/0        00:00:00 xterm  
 4447 pts/0        00:00:00 xterm  
 4491 pts/0        00:00:00 ps  
kbkim@ubuntu:~$ kill -9 4431  
kbkim@ubuntu:~$  
[1]-  Killed                  xterm  
kbkim@ubuntu:~$ ps  
  PID TTY          TIME CMD  
 3547 pts/0        00:00:00 bash  
 4447 pts/0        00:00:00 xterm  
 4493 pts/0        00:00:00 ps  
kbkim@ubuntu:~$ kill -9 -1
```

Sending Signals to Daemons

- Daemons → long-lived processes that provide some services
- Daemons typically have a configuration file which affects their behavior
- Many daemons read their configuration file only at startup
- If the configuration changes, you have to explicitly tell the daemon by sending it a SIGHUP signal
- e.g.) `kill -HUP $(pidof /usr/bin/ssh-agent)`
 - “pidof” → find the pid of the program

Modify process execution priorities

- Not all tasks requires the same amount of execution time
- Linux has the concept of execution priority to deal with this
- Process priority is dynamically altered by the kernel
- You can view the current priority by looking at **top** or **ps -l** and looking at the **PRI** column
- The priority can be biased using nice
 - The current bias can be seen in the NI column in top

```
kdkim@ubuntu:~$ ps -l
```

F	S	UID	PID	PPID	C	PRI	NI	ADDR	SZ	WCHAN	TTY	TIME	CMD
0	S	1000	4798	4796	0	80	0	-	1443	wait	pts/0	00:00:00	bash
0	S	1000	4913	4798	0	80	0	-	2546	poll_s	pts/0	00:00:00	xterm

“nice” command

- Starts a program with a given priority bias
- Peculiar name : **‘nicer’ processes require fewer resources**
- Niceness ranges from +19 (very nice) to -20 (not very nice)
- Non-root user can only specify values from 1 to 19
- the root user specify the full range of values
- Default niceness when using nice is 10
- **To run a command at increased niceness (lower priority)**
 - `nice -10 long-running-command &`
 - `nice -n 10 long-running-command &`
- **To run a command at decreased niceness (higher priority)**
 - `nice --15 important-command &`
 - `Nice -n -15 important-command &`

Example of nice

```
kbkim@ubuntu: ~  
File Edit View Terminal Help  
kbkim@ubuntu:~$ nice --15 firefox &  
[1] 5276  
kbkim@ubuntu:~$ nice: cannot set niceness: Permission denied  
  
[1]+  Exit 1                  nice --15 firefox  
kbkim@ubuntu:~$ nice -1 firefox &  
[1] 5278  
kbkim@ubuntu:~$ nice -10 xterm &  
[2] 5300  
kbkim@ubuntu:~$ ps -l
```

F	S	UID	PID	PPID	C	PRI	NI	ADDR	SZ	WCHAN	TTY	TIME	CMD
0	S	1000	4798	4796	0	80	0	-	1443	wait	pts/0	00:00:00	bash
0	S	1000	5278	4798	8	81	1	-	66093	poll_s	pts/0	00:00:01	firefox
0	S	1000	5300	4798	1	90	10	-	2546	poll_s	pts/0	00:00:00	xterm
0	R	1000	5318	4798	0	80	0	-	626	-	pts/0	00:00:00	ps

```
kbkim@ubuntu:~$
```

Job control

- Most shells offer job control
 - The ability to stop, restart and background a running process
- The shell lets you put **&** on the end of a command line to start in the **background**
- You can hit **Ctrl+z** to **suspend** a running foreground job
- Suspended and backgrounded jobs are **given numbers** by the shell
- These numbers can be given to shell job-control built-in commands
- Job-control commands : **jobs**, **fg**, and **bg**

jobs

- Prints a listing of active jobs and their job numbers
- Job numbers are given in square brackets
 - But when you use them with other job-control builtins, you need to write them with percentage signs
- The jobs marked + and – may  be accessed as %+ or %- as well as by numbers
 - %+ is the shell's idea of the current job
 - The most recently active job
 - %- is the previous current job

Example of jobs

```
kbkim@ubuntu: ~/test
File Edit View Terminal Help
kbkim@ubuntu:~/test$ vi test_while

[1]+  Stopped                  vim test_while
kbkim@ubuntu:~/test$ jobs
[1]+  Stopped                  vim test_while
kbkim@ubuntu:~/test$ xterm&

Running commands in the future

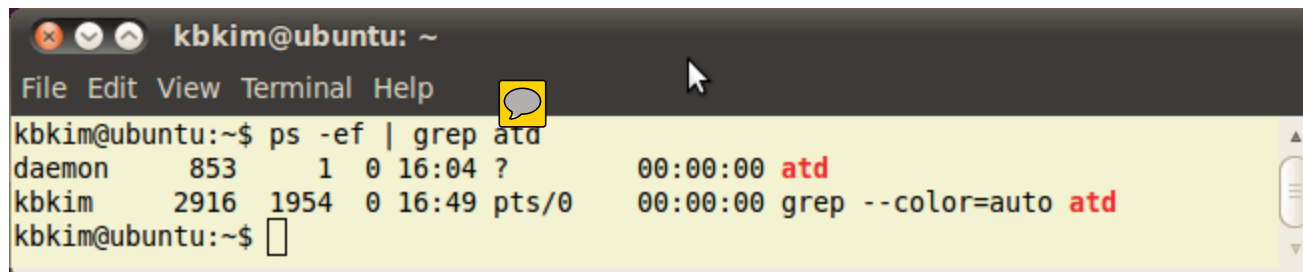

- There is sometimes a need for commands not to be run immediately, but scheduled to run later
- One-off  commands:
 - “at 10:00 tomorrow, email me this reminder message”
 - These are known as “**at commands**”
- Regularly  repeating commands
 - “every night, rebuild the database used by the locate command”
 - These are known as “**cron jobs**”

“at” command

- “at” command
 - To define a “at command”
- The time the command should run is given as a parameter to “at”
- “at” then prompts for the command itself
 - Command(s) exactly as they would be typed in the shell
 - Press “Ctrl+D” to finish
- The “at” daemon will run the command at the specified time

Commands run by “at” daemon

- A command executed by the at daemon
 - Has the permissions of its owner
 - Runs in the directory it was set up
 - Has the environment in which it was set up
 - Does not run in a terminal
- Output from the command
 - Cannot be included in a terminal window

A terminal window titled 'kbbkim@ubuntu: ~' with a menu bar (File, Edit, View, Terminal, Help) and a yellow speech bubble icon. The terminal shows the command 'ps -ef | grep atd' and its output:

```
kbbkim@ubuntu:~$ ps -ef | grep atd
daemon      853      1  0 16:04 ?        00:00:00 atd
kbbkim     2916    1954  0 16:49 pts/0    00:00:00 grep --color=auto atd
```

The prompt 'kbbkim@ubuntu:~\$' is followed by a cursor.

Specification of “at” command

- A command may be specified on standard input instead of interactive console input
 - From a file
 - e.g.) `$ at 16:30 < clean_process.sh`
- Opening Windows
 - The `$DISPLAY` environment variable must be specified
 - e.g.) `echo "DISPLAY=:0.0 xclock &" | at 11:00`

Date&Time specification

- Unadorned times are in the next 24 hours:
 - \$ at 09:30
- Tomorrow can be specified explicitly:
 - \$ at 17:00 tomorrow
- A specific date can be used
 - \$ at 11:00 Nov 11
 - \$ at 00:30 16.04.12 
- Relative times can be specified in minutes, hours, days, or weeks
 - \$ at now + 45 minutes
 - \$ at 16:00 + 3 days

Managing at commands

- “atq” command
 - List any pending at commands
 - The number at the start of each line identifies that at command
- “at -c number”
 - Display the corresponding at command including the environment.
- “atrm number”
 - Remove the corresponding at command

Example

```
kbkim@ubuntu: ~  
File Edit View Terminal Help  
kbkim@ubuntu:~$ echo "DISPLAY=$DISPLAY xclock&" | at 21:00  
warning: commands will be executed using /bin/sh  
job 4 at Sun May 20 21:00:00 2012  
kbkim@ubuntu:~$ atq  
3      Sun May 20 20:00:00 2012 a kbkim  
4      Sun May 20 21:00:00 2012 a kbkim  
kbkim@ubuntu:~$ atrm 3  
kbkim@ubuntu:~$ atq  
4      Sun May 20 21:00:00 2012 a kbkim  
kbkim@ubuntu:~$  
kbkim@ubuntu:~$
```

```
kbkim@ubuntu: ~  
File Edit View Terminal Help  
LESSCLOSE=/usr/bin/lesspipe\ %s\ %s; export LESSCLOSE  
XAUTHORITY=/var/run/gdm/auth-for-kbkim-w7iCB0/database; export XAUTHORITY  
COLORTERM=gnome-terminal; export COLORTERM  
OLDPWD=/etc; export OLDPWD  
cd /home/kbkim || {  
    echo 'Execution directory inaccessible' >&2  
    exit 1  
}  
DISPLAY=:0.0 xclock&  
kbkim@ubuntu:~$
```

Cron jobs

- Periodical jobs
- Specification of simple cron jobs
 - /etc/cron.daily → for jobs to be run daily
 - /etc/cron.hourly → for jobs to be run hourly
 - /etc/cron.monthly → for jobs to be run monthly
 - /etc/cron.weekly → for jobs to be run weekly
 - Each file in the directory is run
 - The files are typically shell scripts
 - With root permissions

Example

```
kbkim@ubuntu: ~  
File Edit View Terminal Help  
kbkim@ubuntu:~$ ls /etc/cron.*  
/etc/cron.d:  
anacron  
  
/etc/cron.daily:  
0anacron  apt      bsdmainutils  logrotate  mlocate      quota  
appport  aptitude  dpkg          man-db     popularity-contest  standard  
  
/etc/cron.hourly:  
  
/etc/cron.monthly:  
0anacron  standard  
  
/etc/cron.weekly:  
0anacron  apt-xapian-index  man-db  
kbkim@ubuntu:~$
```

More complex specification of cron jobs

- Sometimes more control is needed
 - To run jobs at a non-standard time
 - To run jobs as a user other than root
- /etc/cron.d
 - Each file in this directory must contain lines in a specific format
 - When the command should run
 - For which user the command should be run
 - The command to be run
 - Such a file is known as a cron table or crontab

Crontab format

- Blank lines are ignored
- Comments are lines starting with a hash(#)
- Environment variables can be set
 - e.g.) PATH=/usr/local/bin
- Example of cron job specification

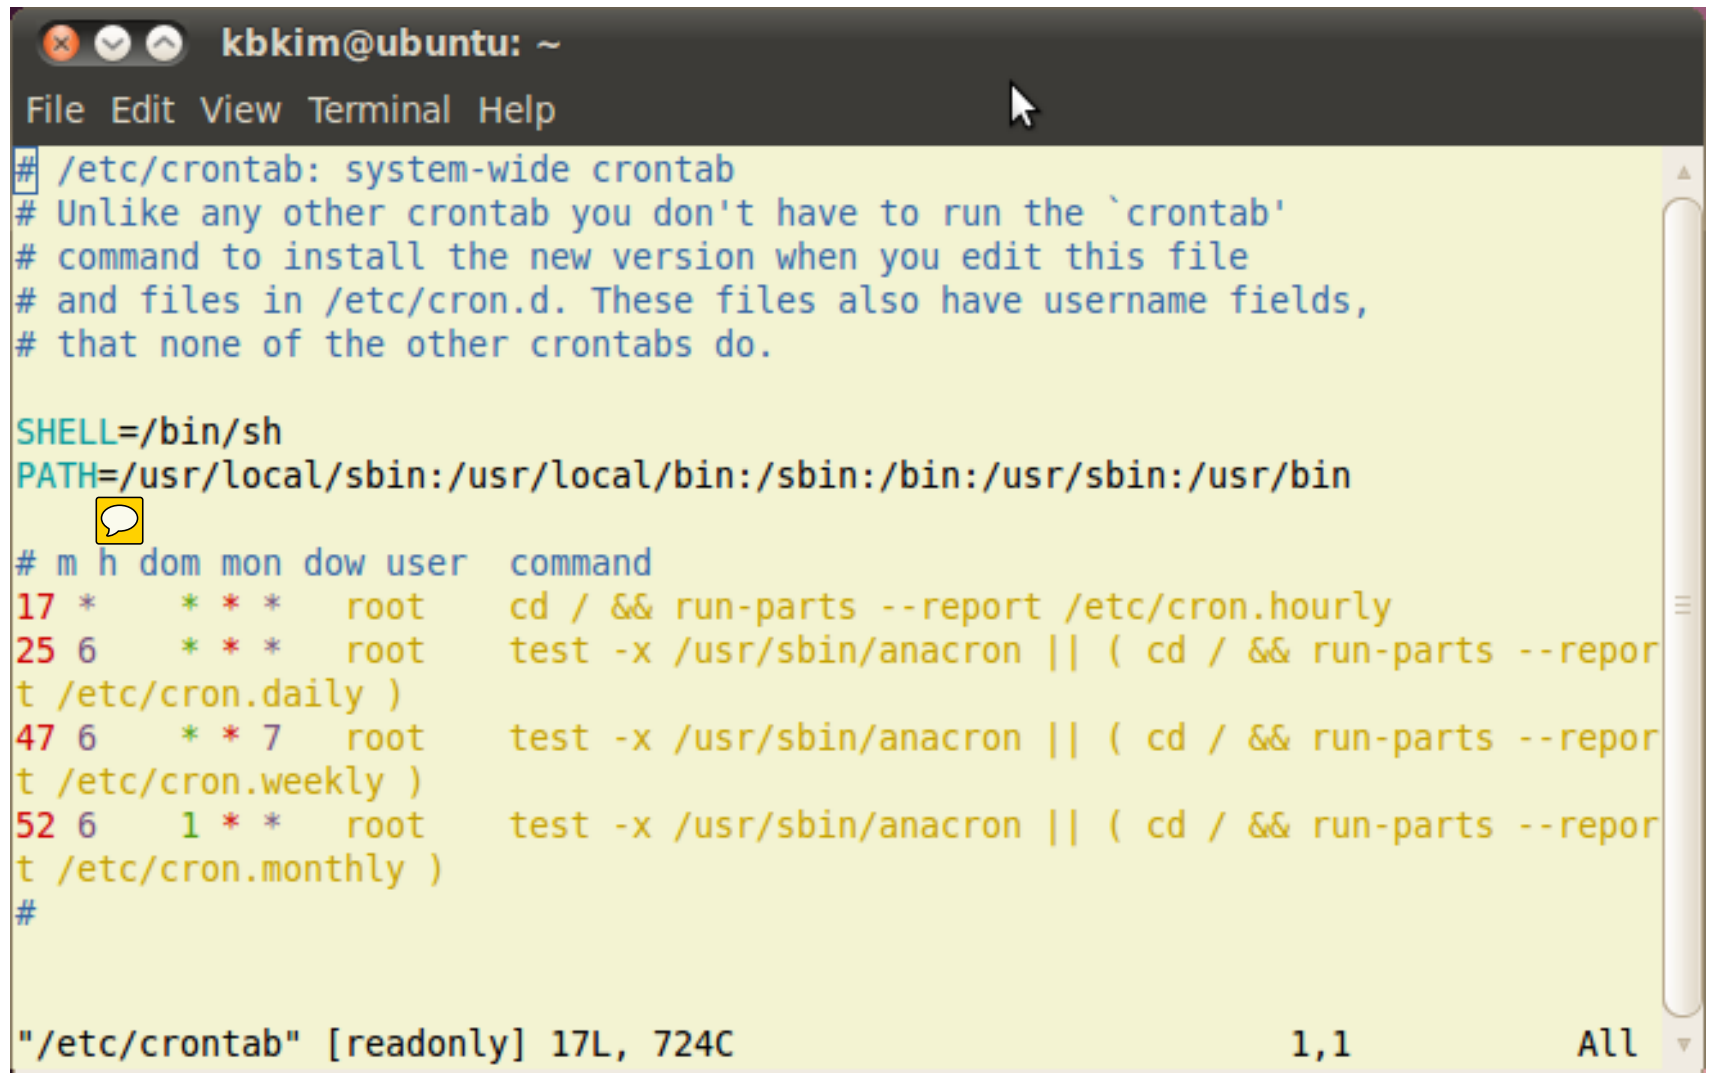

```
30 9 * * * root /usr/local/bin/check_logins
```

 - at 09:30
 - on all days
 - For the root user
 - Run “/usr/local/bin/check_logins”

Crontab date & time specification

- Order of the data and time fields
 - Minute (0–59)
 - Hour (0–23)
 - Day of the month (1–31)
 - Month (1–12)
 - Day of the week (0–7, 0 and 7 are Sunday)
- Fields almost in ascending order
- The command is run when the fields match the current time
- A field containing an asterisk (*) always matches

Example

A terminal window titled 'kdkim@ubuntu: ~' showing the contents of the /etc/crontab file. The window has a menu bar with 'File', 'Edit', 'View', 'Terminal', and 'Help'. The terminal text is as follows:

```
# /etc/crontab: system-wide crontab
# Unlike any other crontab you don't have to run the `crontab'
# command to install the new version when you edit this file
# and files in /etc/cron.d. These files also have username fields,
# that none of the other crontabs do.

SHELL=/bin/sh
PATH=/usr/local/sbin:/usr/local/bin:/sbin:/bin:/usr/sbin:/usr/bin

# m h dom mon dow user  command
17 * * * * root    cd / && run-parts --report /etc/cron.hourly
25 6 * * * root    test -x /usr/sbin/anacron || ( cd / && run-parts --report
t /etc/cron.daily )
47 6 * * 7 root    test -x /usr/sbin/anacron || ( cd / && run-parts --report
t /etc/cron.weekly )
52 6 1 * * root    test -x /usr/sbin/anacron || ( cd / && run-parts --report
t /etc/cron.monthly )
#
```

At the bottom of the terminal, the status bar shows: `"/etc/crontab" [readonly] 17L, 724C` on the left, `1,1` in the center, and `All` on the right.

More complex crontab dates and times

- A list of alternative values for a field are specified by commas:
 - Run at :15 and :45 each hour
 - 15, 45 * * * * httpd /usr/local/bin/generate-stats-page
- A range is specified with a hyphen
 - Run every half hour 09:15 – 17:45 Mon–Fri
 - 15,45 9–17 * * 1–5 root /usr/local/bin/check-faxes
- Numbers rather than names must be used for months and days in lists and ranges
- A step through a range is specified with a slash
 - Run every two hours 08:30–18:30 Mon–Fri
 - 30 8–18/2 * * 1–5 root /usr/local/bin/check-faxes

User crontabs

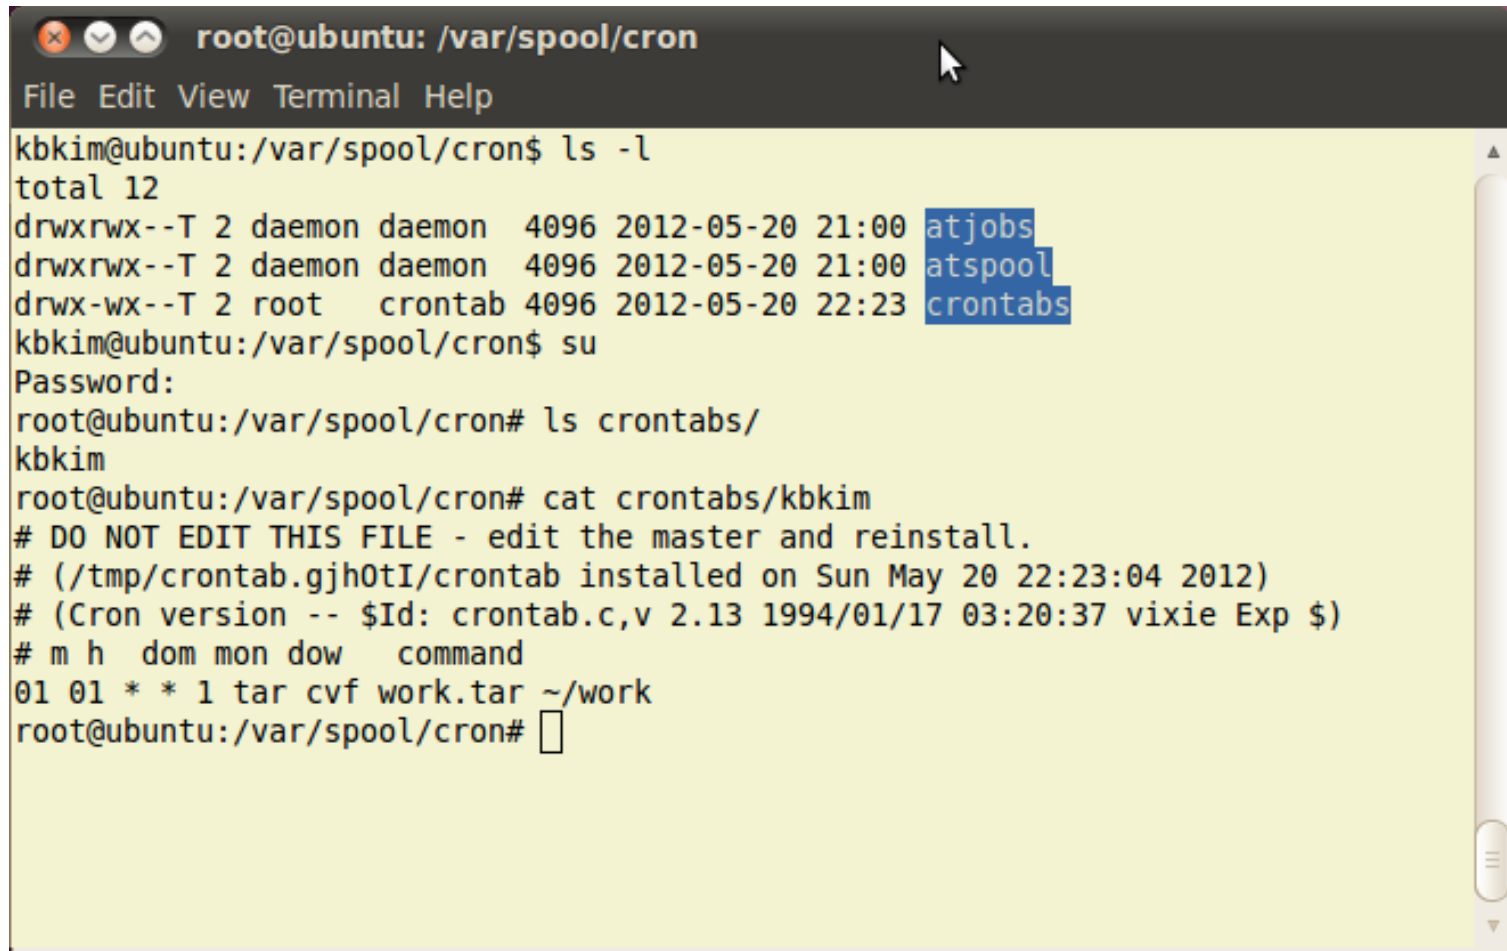

- Sometimes non-root users need to set up cron jobs
- Each user has a crontab file
 - This is not edited directly
 - The “crontab” command manipulates it
 - Use “crontab -e” to edit the crontab
 - Use “crontab -l” to display the crontab

Example of crontab for a normal user

```
kbkim@ubuntu: ~  
File Edit View Terminal Help  
kbkim@ubuntu:~$ crontab -e  
no crontab for kbkim - using an empty one  
  
Select an editor. To change later, run 'select-editor'.  
1. /bin/ed  
2. /bin/nano <---- easiest  
3. /usr/bin/vim.basic  
4. /usr/bin/vim.tiny  
  
Choose 1-4 [2]: 2
```

```
kbkim@ubuntu: ~  
File Edit View Terminal Help  
GNU nano 2.2.2 File: /tmp/crontab.gjh0tI/crontab Modified  
  
# m h dom mon dow command  
01 01 * * 1 tar cvf work.tar ~/work  
  
Save modified buffer (ANSWERING "No" WILL DESTROY CHANGES) ?  
Y Yes  
N No ^C Cancel
```

Example of crontab for a normal user

A terminal window titled 'root@ubuntu: /var/spool/cron' with a menu bar (File, Edit, View, Terminal, Help). The user 'kbkim' runs 'ls -l' in '/var/spool/cron', showing files 'atjobs', 'atpool', and 'crontabs'. Then, they run 'su' to become root. As root, they run 'ls crontabs/' showing 'kbkim'. Finally, they run 'cat crontabs/kbkim', displaying the crontab content: a warning not to edit, installation info, cron version, and a scheduled task to create a tar archive of the work directory every 01st of each month.

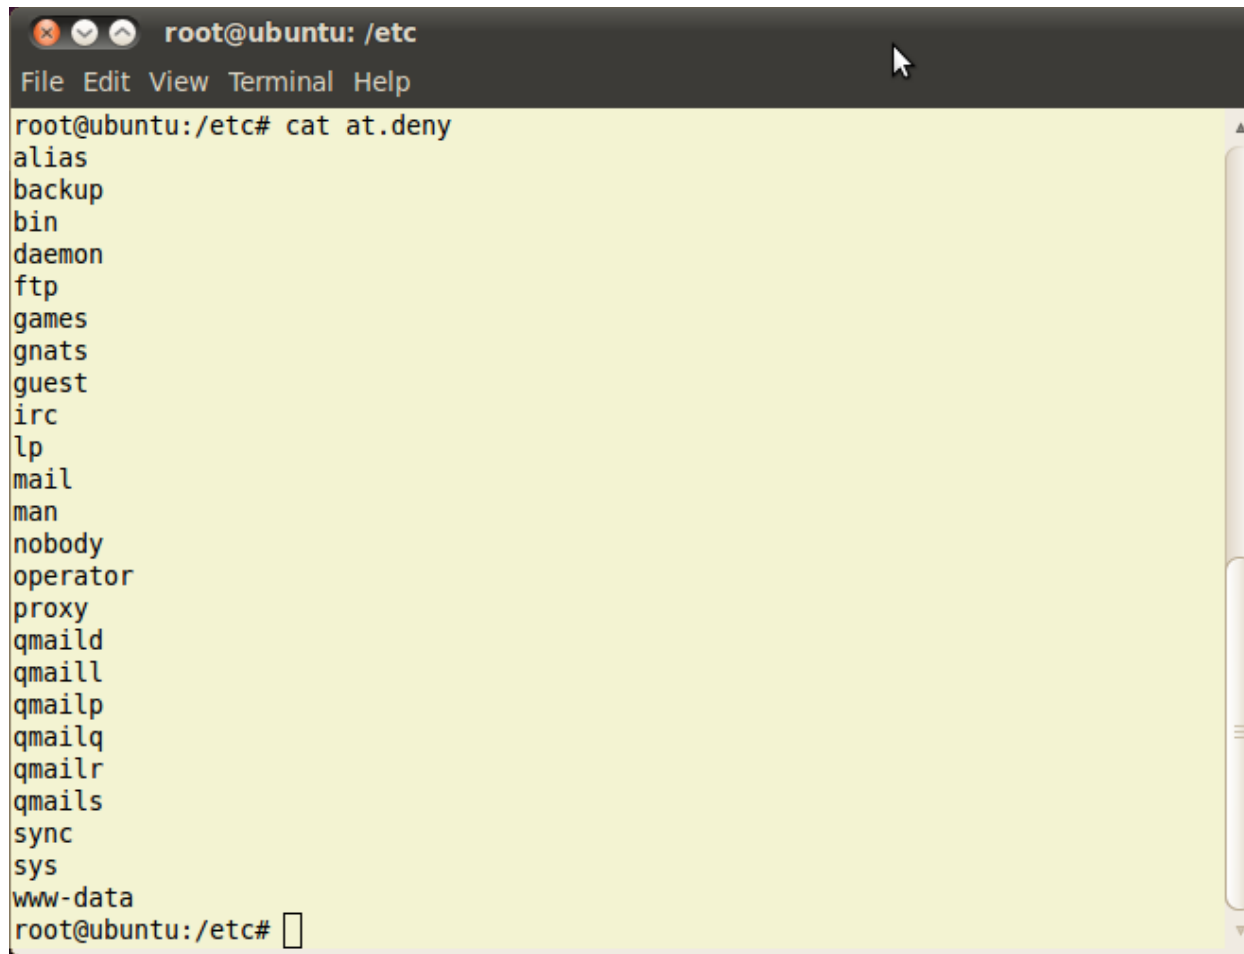

```
root@ubuntu: /var/spool/cron
File Edit View Terminal Help

kbkim@ubuntu:/var/spool/cron$ ls -l
total 12
drwxrwx--T 2 daemon daemon 4096 2012-05-20 21:00 atjobs
drwxrwx--T 2 daemon daemon 4096 2012-05-20 21:00 atpool
drwx-wx--T 2 root  crontab 4096 2012-05-20 22:23 crontabs
kbkim@ubuntu:/var/spool/cron$ su
Password:
root@ubuntu:/var/spool/cron# ls crontabs/
kbkim
root@ubuntu:/var/spool/cron# cat crontabs/kbkim
# DO NOT EDIT THIS FILE - edit the master and reinstall.
# (/tmp/crontab.gjh0tI/crontab installed on Sun May 20 22:23:04 2012)
# (Cron version -- $Id: crontab.c,v 2.13 1994/01/17 03:20:37 vixie Exp $)
# m h dom mon dow  command
01 01 * * 1 tar cvf work.tar ~/work
root@ubuntu:/var/spool/cron#
```

Permission of “at” command and “cron” job

- Non-root users can be prohibited from having crontabs
 - If /etc/cron.allow exists then only users listed in it may have a crontab
 - If it does not exist but /etc/cron.deny does, then users not listed in the latter may have a crontab
 - If neither exist, then all users may have crontabs
- Permissions for running at commands are similar
 - /etc/at.allow and /etc/at.deny

Example

A terminal window titled "root@ubuntu: /etc" with a menu bar containing "File", "Edit", "View", "Terminal", and "Help". The terminal shows the command "cat /etc/at.deny" being executed, which lists the following users: alias, backup, bin, daemon, ftp, games, gnats, guest, irc, lp, mail, man, nobody, operator, proxy, qmaild, qmaill, qmailp, qmailq, qmailr, qmails, sync, sys, and www-data. The prompt "root@ubuntu:/etc#" is visible at the bottom.

```
root@ubuntu: /etc
File Edit View Terminal Help
